Worksheet 9 Trigonometric Fourier Series

Worksheet 9

To accompany Chapter 4.1 Trigonometric Fourier Series

We will step through this worksheet in class.

You are expected to have at least watched the video presentation of Chapter 4.1 of the notes before coming to class. If you haven't watch it afterwards!

Motivating Example

In the class I will demonstrate the Fourier Series demo (see Notes).

Symmetry in Trigonometric Fourier Series

There are simplifications we can make if the original periodic properties has certain properties:

- If $f(t)$ is odd, $a_0 = 0$ and there will be no cosine terms so $a_n = 0\ \forall n > 0$
- If $f(t)$ is even, there will be no sine terms and $b_n = 0\ \forall n > 0$. The DC may or may not be zero.
- If $f(t)$ has *half-wave symmetry* only the odd harmonics will be present. That is a_n and b_n is zero for all even values of n (0, 2, 4, ...)

Odd, Even and Half-wave Symmetry

Recall

- An *odd* function is one for which $f(t) = -f(-t)$. The function $\sin t$ is an *odd* function.
- An *even* function is one for which $f(t) = f(-t)$. The function $\cos t$ is an *even* function.

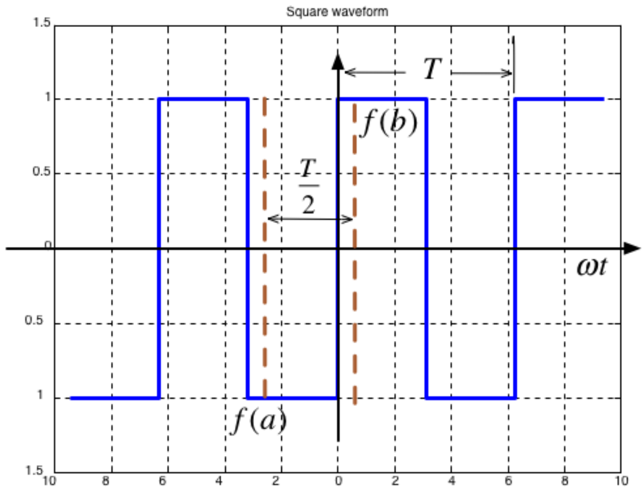
Half-wave symmetry

- A periodic function with period T is a function for which $f(t) = f(t+T)$
- A periodic function with period T, has *half-wave symmetry* if $f(t) = -f(t+T/2)$

Symmetry in Common Waveforms

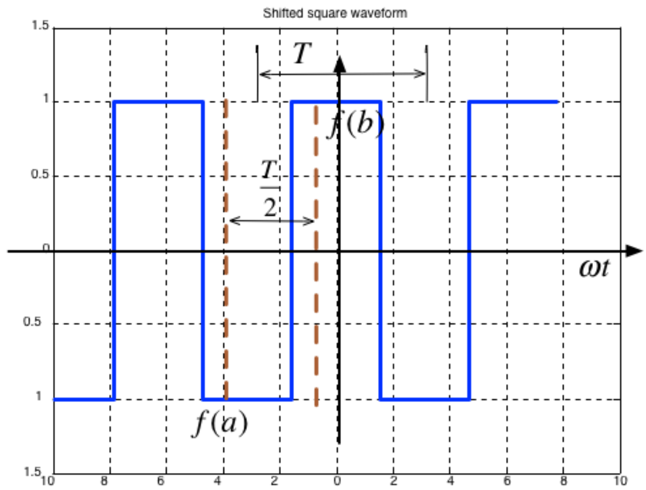
To reproduce the following waveforms (without annotation) publish the script waves.m.

Squarewave



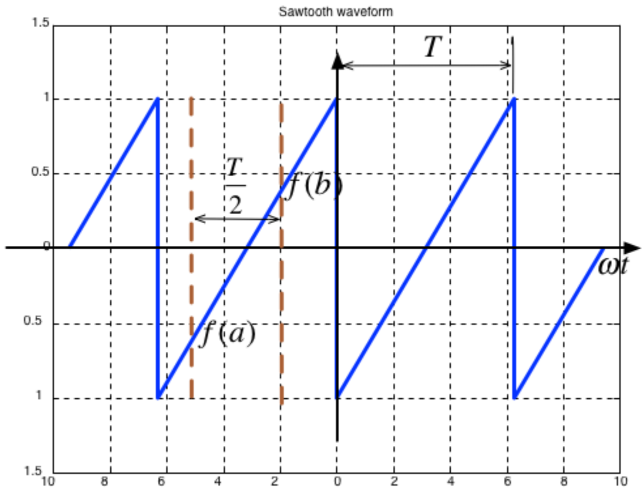
- Average value over period T is ...?
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Shifted Squarewave



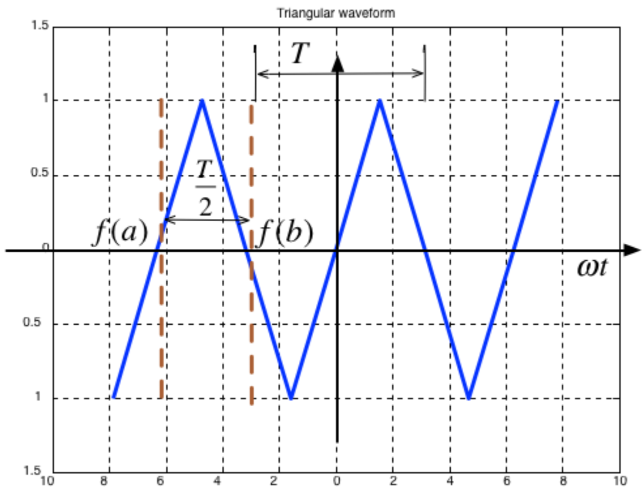
- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Sawtooth



- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Triangle

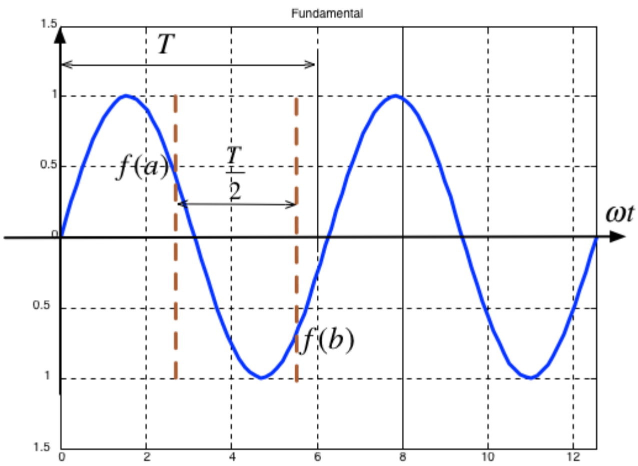


- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Symmetry in fundamental, Second and Third Harmonics

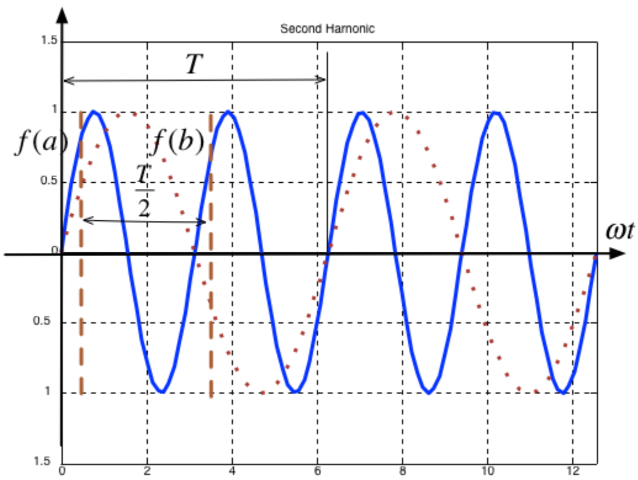
In the following, $T/2$ is taken to be the half-period of the fundamental sinewave.

Fundamental



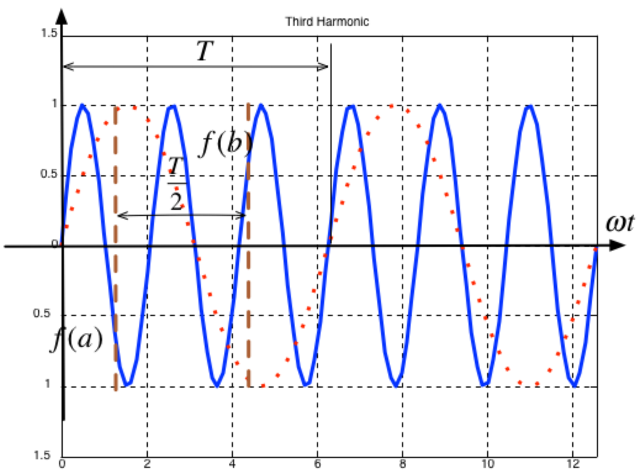
- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Second Harmonic



- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

Third Harmonic



- Average value over period T is
- It is an **odd/even** function?
- It **has/has not** half-wave symmetry $f(t) = -f(t + T/2)$?

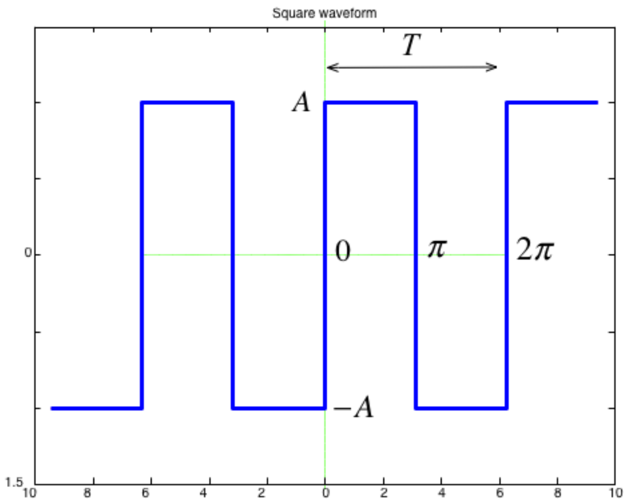
Some simplifications that result from symmetry

- The limits of the integrals used to compute the coefficents a_n and b_n of the Fourier series are given as $0 \to 2\pi$ which is one period T
- We could also choose to integrate from $-\pi \to \pi$
- If the function is *odd*, or *even* or has *half-wave symmetry* we can compute a_n and b_n by integrating from $0 \to \pi$ and multiplying by 2.
- If we have *half-wave symmetry* we can compute a_n and b_n by integrating from $0 \to \pi/2$ and multiplying by 4.

(For more details see page 7-10 of the textbook)

Computing coefficients of Trig. Fourier Series in Matlab

As an example let's take a square wave with amplitude $\pm A$ and period T.



Solution

Solution: See square_ftrig.mlx. Script confirms that:

- $a_0 = 0$
- $a_i = 0$: function is odd
- $b_i = 0$: for i even - half-wave symmetry

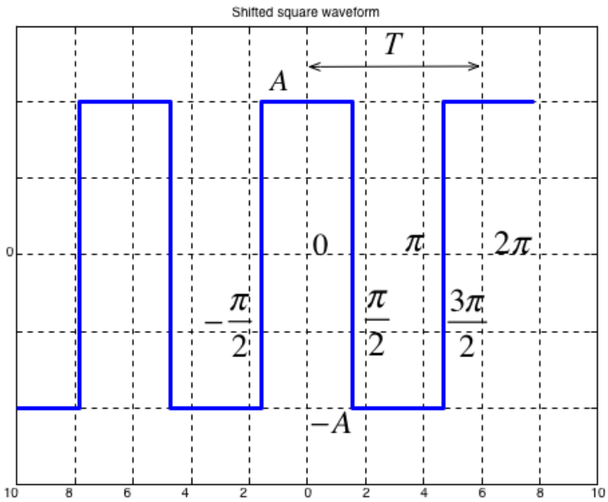
```
ft =

(4*A*sin(t))/pi + (4*A*sin(3*t))/(3*pi) + (4*A*sin(5*t))/(5*pi) + (4*A*sin(7*t))/(7*pi) + (4*A*sin(9*t))/(9*pi) + (4
```

Note that the coefficients match those given in the textbook (Section 7.4.1).

$$f(t) = \frac{4A}{\pi}\left(\sin \Omega_0 t + \frac{1}{3}\sin 3\Omega_0 t + \frac{1}{5}\sin 5\Omega_0 t + \cdots\right) = \frac{4A}{\pi}\sum_{n=\mathrm{odd}} \frac{1}{n}\sin n\Omega_0 t$$

Using symmetry - computing the Fourier series coefficients of the shifted square wave



- As before $a_0 = 0 a_0 = 0$
- We observe that this function is even, so all $b_k b_k$ coefficents will be zero
- The waveform has half-wave symmetry, so only odd indexed coeeficents will be present.
- Further more, because it has half-wave symmetry we can just integrate from $0 \to \pi/2 0 \to \pi/2$ and multiply the result by 4.

See shifted_sq_ftrig.mlx.

```
ft =

(4*A*cos(t))/pi - (4*A*cos(3*t))/(3*pi) + (4*A*cos(5*t))/(5*pi) - (4*A*cos(7*t))/(7*pi) + (4*A*cos(9*t))/(9*pi) - (4
```

Note that the coefficients match those given in the textbook (Section 7.4.2).

$$f(t) = \frac{4A}{\pi}\left(\cos \Omega_0 t - \frac{1}{3}\cos 3\Omega_0 t + \frac{1}{5}\cos 5\Omega_0 t - \cdots\right) = \frac{4A}{\pi} \sum_{n=\text{odd}} (-1)^{\frac{n-1}{2}} \frac{1}{n}\cos n\Omega_0 t$$
